## CROSS-REFERENCE TO RELATED APPLICATIONS

This application is a continuation (and claims the benefit of priority under 35 USC 120) of U.S. application Ser. No. 10/712,081, filed Nov. 13, 2003 now U.S. Pat. No. 7,550,423 which is a divisional of U.S. application Ser. No. 09/670,249, filed Sep. 26, 2000, now U.S. Pat. No. 6,703,481, which is a continuation of U.S. application Ser. No. 08/855,204, filed May 13, 1997, now U.S. Pat. No. 6,262,229 that claims the benefit of provisional application No. 60/032,358, filed Dec. 4, 1996. The disclosures of the prior applications are considered part of (and are incorporated by reference in) the disclosure of this application.

## BACKGROUND OF THE INVENTION

Native somatostatin is comprised of both a 14-amino acid isoform (somatostatin-14) and a 28-amino acid isoform (somatostatin-28). Heiman, et al., *Neuroendocrinology*, 45:429-436 (1987). Because of the short half-life of the native somatostatin, various somatostatin analogs have been developed, e.g., for the treatment of acromegaly. Raynor, et al., *Molecular Pharmacol.* 43:838 (1993). Five distinct somatostatin receptors have been identified and characterized. Hoyer, et al., *Naunyn-Schmiedeberg's Arch. Pharmacol.*, 350:441 (1994). Somatostatin produces a variety of effects, including modulation of hormone release, e.g., growth hormone, glucagon, insulin, amylin, and neurotransmitter release. Some of these effects have been associated with its binding to a specific somatostatin receptor. For example, the inhibition of growth hormone has been attributed to the somatostatin type-2 receptor ("SSTR-2") (Raynor, et al., *Molecular Pharmacol.* 43:838 (1993); Lloyd, et al., *Am. J. Physiol.* 268:G102 (1995)) while the inhibition of insulin has been attributed to the somatostatin type-5 receptor ("SSTR-5") (Coy, et al. 197:366-371 (1993)). The following invention relates to a novel class of somatostatin analogs which are antagonists to somatostatin receptors.

The peptides of the invention can be used to promote the release of growth hormone or insulin in a subject (e.g., a mammal such as a human patient). Thus, the peptides are useful in the treatment of physiological conditions in which the promotion of the release of growth hormone or insulin is of benefit. The peptides of the invention can also be used in enhancing wound healing or promoting angiogenesis. Also, peptides of the invention having a Tyr(I) residue can be used to image cells containing somatostatin receptors. Such peptides of the invention can be used either in vivo to detect cells having somatostatin receptors (e.g., cancer cells) or in vitro as a radioligand in a somatostatin receptor binding assay. The peptide of the invention can also be used as vectors to target cells with radioactive isotopes.

A therapeutically effective amount of a peptide of this invention and a pharmaceutically acceptable carrier substance (e.g., magnesium carbonate, lactose, or a phospholipid with which the therapeutic compound can form a micelle) together form a therapeutic composition (e.g., a pill, tablet, capsule, or liquid) for administration (e.g., orally, intravenously, transdermally, pulmonarily, vaginally, subcutane-

14

ously, nasally, iontophoretically, or by intratracheally) to a subject in need of the peptide. The pill, tablet, or capsule can be coated with a substance capable of protecting the composition from the gastric acid or intestinal enzymes in the subject's stomach for a period of time sufficient to allow the composition to pass undigested into the subject's small intestine. The therapeutic composition can also be in the form of a biodegradable or nonbiodegradable sustained release formulation for subcutaneous or intramuscular administration. See, e.g., U.S. Pat. Nos. 3,773,919 and 4,767,628 and PCT Application No. WO 94/00148. Continuous administration can also be obtained using an implantable or external pump (e.g., INFUSAID™ pump) to administer the therapeutic composition.

The dose of a peptide of the present invention for treating the above-mentioned diseases or disorders varies depending upon the manner of administration, the age and the body weight of the subject, and the condition of the subject to be treated, and ultimately will be decided by the attending physician or veterinarian. Such an amount of the peptide as determined by the attending physician or veterinarian is referred to herein as a "therapeutically effective amount."

Also contemplated within the scope of this invention is a peptide covered by the above generic formula for both use in treating diseases or disorders associated with the need to promote the release of growth hormone or insulin, and use in detecting somatostatin receptors, e.g., radioimaging.

Other features and advantages of the present invention will be apparent from the detailed description and from the claims.

#### Synthesis

The synthesis of short peptides is well examined in the peptide art. See e.g., Stewart, et al., Solid Phase Peptide Synthesis (Pierce Chemical Co., 2d ed., 1984). The following describes the synthesis of D-β-Nal-Cys-Pal-D-Trp-Lys-Val-Cys-β-Nal-NH<sub>2</sub> and D-β-Nal-Cpa-Tyr-D-Trp-Lys-Val-Phe-Thr-NH<sub>2</sub>. Other peptides of the invention can be prepared in an analogous manner by a person of ordinary skill in the art.

#### (a) Synthesis of H<sub>2</sub>-β-Nal-D-Cys-Pal-D-Trp-Lys-Val-Cys-β-Nal-NH<sub>2</sub>

1) Boc-β-naphthylalanine-S-methylbenzyl-D-cysteine-3-pyridyl-2-alanine-D-tryptophan-N<sup>ε</sup>-benzyloxycarbonyl-lysine-valine-S-methylbenzyl-cysteine-β-naphthylalanine-benzhydrylamine resin

Benzhydrylamine-polystyrene resin (Advanced ChemTech, Inc., Louisville, Ky.) (1.2 g; 0.5 mmole) in the chloride ion form was placed in the reaction vessel of an Advanced ChemTech™ peptide synthesizer programmed to perform the following reaction cycle: (a) methylene chloride; (b) 33% trifluoroacetic acid in methylene chloride (2 times for

## 15

1 and 25 min each); (c) methylene chloride; (d) ethanol; (e) methylene chloride; and (f) 10% triethylamine in chloroform.

The neutralized resin was stirred with Boc-O- $\beta$ -naphthylalanine and diisopropylcarbodiimide (1.5 mmole each) in methylene chloride for 1 hr, and the resulting amino acid resin was then cycled through steps (a) to (f) in the above wash program. The following amino acids (1.5 mmole) were then coupled successively by the same procedure: Boc-S-methylbenzyl-Cys, Boc-Val, Boc-N<sup>e</sup>-benzyloxycarbonyl-lysine, Boc-D-Trp, Boc-Pal, and Boc-S-methylbenzyl-D-Cys and Boc- $\beta$ -Nal. After washing and drying, the completed resin weighed 2.0 g.

2)  $\beta$ -naphthylalanine-c[D-cysteine-3-pyridyl-2-alanine-D-tryptophan-lysine-valine-cysteine]- $\beta$ -naphthylalanine-NH<sub>2</sub>

The completed resin described in (1) (1.0 g, 0.25 mmole) was mixed with anisole (5 ml), dithiothreitol (100 mg), and anhydrous hydrogen fluoride (35 ml) at 0° C. and stirred for 45 min. Excess hydrogen fluoride was evaporated rapidly under a stream of dry nitrogen, and the free peptide is precipitated and washed with ether. The crude peptide was then dissolved in 500 ml of 90% acetic acid to which was added a concentrated solution of I<sub>2</sub>/MeOH until a permanent brown color is observed. Excess I<sub>2</sub> is removed by addition of ascorbic acid and the solution evaporated to a small volume which was applied to a column (2.5×90 cm) of Sephadex™ G-25, which was eluted with 50% AcOH. Fractions containing a major component by ultraviolet (UV) absorption and thin layer chromatography were then pooled, evaporated to a small volume, and applied to a column (1.5×70 cm) of Vydac™ octadecylsilane silica (10-15  $\mu$ m). This was eluted with a linear gradient of acetonitrile in 0.1% trifluoroacetic acid in water. Fractions were examined by thin layer chromatography (TLC) and analytical high performance liquid chromatography (HPLC) and pooled to give maximum purity. Repeated lyophilization of the solution from water gave the desired product as a white, fluffy powder. The product was found to be homogeneous by HPLC and TLC. Amino acid analysis of an acid hydrolysate and matrix-assisted laser desorption (MALD) mass spectroscopy confirmed the composition of the octapeptide.

(b) Synthesis of H<sub>2</sub>-D- $\beta$ -Nal-Cpa-Tyr-D-Trp-Lys-Val-Phe-Thr-NH<sub>2</sub>

1) Boc- $\beta$ -D-naphthylalanine-D-4-chlorophenylalanine-O-dichlorobenzyl-tyrosine-D-tryptophan-N<sup>e</sup>-benzyloxycarbonyl-lysine-valine-S-phenylalanine-O-benzyl-threonine-benzhydrylamine resin

Benzhydrylamine-polystyrene resin (Advanced ChemTech™, Inc.) (1.2 g, 0.5 mmole) in the chloride ion form was placed in the reaction vessel of an Advanced ChemTech peptide synthesizer programmed to perform the following reaction cycle: (a) methylene chloride; (b) 33% trifluoroacetic acid in methylene chloride (2 times for 1 and 25 min each); (c) methylene chloride; (d) ethanol; (e) methylene chloride; and (f) 10% triethylamine in chloroform.

The neutralized resin was stirred with Boc-O-benzylthreonine and diisopropylcarbodiimide (1.5 mmole each) in methylene chloride for 1 hr and the resulting amino acid resin was cycled through steps (a) to (f) in the above wash program. The following amino acids (1.5 mmole) were then coupled successively by the same procedure: Boc-phenylalanine, Boc-Val, Boc-N<sup>e</sup>-benzyloxycarbonyl-lysine, Boc-D-Trp, Boc-O-

## 16

dichlorobenzyl-Tyr, and Boc-D-4-chlorophenylalanine, and Boc- $\beta$ -D-Nal. After washing and drying, the completed resin weighed 2.1 g.

2)  $\beta$ -D-naphthylalanine-D-4-chlorophenylalanine-tyrosine-D-tryptophan-lysine-valine-phenylalanine-threonine-NH<sub>2</sub>

The peptide resin from (1) was subjected to HF cleavage as described above. Column purification as described yielded the desired compound as a white, fluffy powder (170 mg) which is found to be homogeneous by HPLC and TLC. Amino acid analysis of an acid hydrolysate and MALD mass spectroscopy confirms the composition of the peptide.

Peptides containing C-terminal substituted amides can be made by solid phase methods by displacing the appropriate peptide off the solid phase with the corresponding amine. Alternatively, these analogs may be synthesized by solution-phase peptide synthesis methods in which the growing peptide chain is maintained in solution in an organic solvent during synthesis and assembled by iterative coupling/deprotection cycles. Final removal of the side chain protecting groups yields the desired peptide after appropriate purification. Peptides containing N-terminal substitutions (e.g., where R<sub>1</sub> is E, CO, or E<sub>1</sub>SO<sub>2</sub> (where E<sub>1</sub> is heterocycle lower alkyl) substituted with hydroxy lower alkyl and R<sub>2</sub> is H such as 4-(2-hydroxyethyl)-1-piperazinylacetyl or 4-(2-hydroxyethyl)-1-piperidineethanesulfonyl) can be synthesized as described in PCT Application No. WO 95/04752.

Bioassay on the In Vitro Release of Growth Hormone  
(a) Rat Pituitary Cell Dispersion

Pituitaries from adult Charles River CD male rats (Wilmington, Mass.) housed under controlled conditions were dispersed and cultured using aseptic technique by modification of previously described methods (Hoefer, M. T., et al., *Mol. Cell. Endocrinol.* 35:229 (1984); Ben-Jonathan, N., et al., *Methods Enzymol.* 103:249 (1983); and Heiman, M. L., et al., *Endocrinology* 116:410 (1985)). Pituitaries were removed from sacrificed rats, sectioned, and then placed into a siliconized, liquid scintillation vial containing 2 ml 0.2% trypsin (Worthington Biochemicals, Freehold, N.J.) in sterile-filtered Krebs-Ringer bicarbonate buffer supplemented with 1% bovine serum albumin, 14 mM glucose, modified Eagle medium (MEM) vitamin solution, and MEM amino acids (Gibco Laboratories, Grand Island, N.Y.) (KRBGA). All glassware was siliconized as described by Sayers, et al., *Endocrinology* 88:1063 (1971). The fragments were incubated in a water bath for 35 min at 37° C. with agitation. The vial contents then were poured into a scintillation vial containing 2 ml 0.1% DNase (Sigma Chemical Co., St. Louis, Mo.) in KRBGA and incubated for 2 min at 37° C. with agitation. After incubation, the tissue was decanted into a 15 ml centrifuge tube and allowed to settle. Medium was discarded, and pituitary sections were washed 3 times with 1 ml fresh-KRBGA. The cells were then dispersed in 2 ml 0.05% LBI (lima bean trypsin inhibitor, Worthington Biochemicals) by gently drawing the fragments into and expelling them out of a siliconized, fire polished Pasteur pipette. Dispersed cells were then filtered through a 630  $\mu$ m diameter Nylon mesh (Tetko, Elmsford, N.Y.) into a fresh 15 ml centrifuge tube. An additional 2 ml of 0.05% LBI solution was used to rinse the first tube and was transferred to the second tube with filtering.

(b) Cell Culture

The dispersed cells were then further diluted with approximately 15 ml sterile-filtered Dulbecco's modified Eagle medium (GIBCO), which was supplemented with 2.5% fetal calf serum (GIBCO), 3% horse serum (GIBCO), 10% fresh

17

rat serum (stored on ice for no longer than 1 hr) from the pituitary donors, 1% MEM non-essential amino acids (GIBCO), and gentamycin (10 ng/ml; Sigma) and nystatin (10,000 U/ml; GIBCO). The cells were poured into a 50 ml round-bottomed glass extraction flask with a large diameter opening and then randomly plated at a density of approximately 200,000 cells per well (Co-star cluster 24; Rochester Scientific Co., Rochester, N.Y.). The plated cells were maintained in the above Dulbecco's medium in a humidified atmosphere of 95% air and 5% CO<sub>2</sub> at 37° C. for 4-5 days.

(c) Experimental Incubation and IC<sub>50</sub> Determination

In preparation for a hormone challenge, the cells were washed 3 times with medium 199 (GIBCO) to remove old medium and floating cells. Each treatment well contained a total volume of 1 ml medium 199 containing 1% BSA (fraction V; Sigma) with treatments as described below. Each antagonist candidate was tested using a single 24-well cell culture plate. Each treatment was performed in triplicate. Each plate contained 8 treatment groups: one 1 nM growth hormone releasing factor (GRF) (1-29)NH<sub>2</sub>-stimulated control group; one 1 nM somatostatin-inhibited control group in the presence of 1 nM GRF(1-29)NH<sub>2</sub>; and 6 doses of a given antagonist in the presence of both 1 nM SRIF and 1 nM GRF per plate. After 3 hrs at 37° C. in a air/carbon dioxide atmosphere (95/5%), the medium was removed and stored at -20° C. until radioimmunoassayed for growth hormone content. IC<sub>50</sub>'s of each antagonist versus 1 nM SRIF were calculated using a computer program (SigmaPlot, Jandel Scientific, San Rafael, Calif.) with the maximum response constrained to the value of the 1 nM GRF(1-29)NH<sub>2</sub>-stimulated control. These IC<sub>50</sub>'s are presented in Table I.
